

Scalability & Future Plan

Date	01 October 2026
Team ID	SWTID-2026-4323
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	1 Mark

Scalability & Future Plan:

This document outlines how the current project solution can be scaled to handle larger user bases, increased data loads, or extended features in the future. It also captures the team's roadmap for enhancing and evolving the project beyond its current state.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	The current workflow is mainly configured for Standard Laptop requests.	Other IT hardware requests require separate configuration.	Medium
2	Laptop configuration tasks are assigned to the Hardware group, but the process does not automatically check hardware inventory availability.	A task may be created even when the required laptop is unavailable.	High
3	The current implementation has limited custom notifications and escalation mechanisms.	Users and support teams may not receive automatic updates for delayed tasks.	Medium

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Designed primarily for Standard Laptop requests.	Extend the workflow to support larger numbers of concurrent IT hardware requests and additional catalog items.
2	Data Storage	Uses ServiceNow Service Catalog, Requested Item and Catalog Task records.	Use ServiceNow tables and data-management capabilities to handle increasing request and task records.

3	Performance	Flow automatically creates tasks after approval.	Optimize flows and actions, remove unnecessary processing, and monitor flow execution for larger request volumes
4	Security	Uses ServiceNow roles, approvals, and assignment groups.	Apply appropriate role-based access, approval controls, and restricted access to procurement records

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Add dashboards and reports for procurement requests, task status, processing time, and SLA performance.	4–6 Months	Provides better monitoring and helps IT teams analyze procurement performance.
Phase 2	Extend automation to additional hardware items such as monitors, keyboards, and desktops.	1–2 Months	Provides a common automated procurement process for multiple IT assets.
Phase 3	Add automatic inventory availability checking before creating fulfillment tasks.	2–3 Months	Reduces delays caused by unavailable hardware.
Phase 4	Add email/ServiceNow notifications and escalation for pending or overdue tasks	3–4 Months.	Improves communication and reduces fulfillment delays.
